## Notes:

1. Semi-transparent bkg that previews map or shows physical environment
2. This map will show administrative boundaries for the 4 watershed regions (HUC2) in the western US and will breakdown into sub-regions (HUC4), and watersheds (HUC10). Note that the exact breakdowns may shift in the final version. The map defaults to HUC2, when you click a region, the map recenters and subregions appear, when you click a subregion, the map recenters and watersheds are visible.
3. EPA data is introduced. Nothing fancy happening in the background.
4. This is a choropleth map with the total number of threatened species by watershed (HUC10). Users can click on a watershed and find out info about that watershed.
5. Introduce US Bureau of Reclamation, water reclamation projects.
6. This map shows water reclamation project points overlaying on either the choropleth map or the administrative watersheds map.
7. One watershed will be featured. This will be a narrative about the impact of projects on the physical environment using EPA data.
8. This map will show sub-watersheds (HUC12), water features, and USBR water project points. It will be restricted to a small geographic area (one watersheds (HUC10)) to illustrate the story above. Features will be clickable and info will populate in a box to the left of the map.
9. Wrap-up copy. References, etc.
